# Discussion Points

- Need for relatively rapid and accurate validation of performance of new coatings on aluminum
  - Uses current test methods (love 'em or hate 'em, that's what we've got for now)
  - Supports R&D, acquisition, and qualification needs
  - Is easy and inexpensive (relatively)
- Need for a document which establishes NAVAIR engineering authority position on how to implement non-chromate coatings systems

# Galvanic Test Assemblies

- Why?
  - Incorporates typical galvanic couples of materials on weapon systems
  - These materials typically are the “business end” of where corrosion is occurring, not large “open” areas
  - Simple way to build upon flat panel testing and data
  - This design creates large cathode interface and presents difficult challenge for coatings
  - Beach exposure validation results in 6 to 8 months

# NC Coating Test Parameters on Galvanic Assemblies

- Substrate: 7075-T6 aluminum
- Surface treatments: MIL-DTL-81706 Type I (chromate) and Type II (trivalent chromium), MIL-A-8625 Type IC (boric sulfuric), adhesion promoter, sol-gel adhesion promoter
- Primers: MIL-PRF-23377 Class N, Type I; Metal rich primer; MIL-PRF-23377 Class C, Type I; MIL-PRF-85582 Class N, Type I; MIL-PRF-85582 Class C, Type I; MIL-PRF-85582 Class N, Type II
- Topcoat: MIL-PRF-85285 Type IV- applied over half of each panel
- Fasteners/washers: CRES 316, TiAl6V4
- Fasteners/washers installed “dry” and torqued to 100 inch-lbs after all coatings applied and cured for 14 days at ambient lab conditions
- Panels set at approximately 30 degrees in test chambers
- Corrosion tests: ASTM B117 (3 weeks), ASTM G85 Annex 4 (SO<sub>2</sub>) ( 2 weeks), beachfront at Kennedy Space Center corrosion test site (6-8 months)

# Primer/Topcoat over Type I Conversion Coating (chromated)

-after 3 Weeks in ASTM B117

As Painted and assembled

MIL-PRF-23377 Class N

Metal-rich primer

MIL-PRF-23377 Class C

After 3 weeks B117-  
fasteners removed

After 3 weeks B117-  
Coatings removed

# Primer/Topcoat over Type I Conversion Coating (chromated)

-after 3 Weeks in ASTM B117

As Painted and assembled

MIL-PRF-85582 Class N

MIL-PRF-23377 Class N

MIL-PRF-85582 Class C

After 3 weeks B117-  
fasteners removed

After 3 weeks B117-  
Coatings removed

# Primer/Topcoat over Type II Conversion Coating (tri-chrome)

-after 3 Weeks in ASTM B117

As Painted and assembled

MIL-PRF-23377 Class N

Metal-rich primer

MIL-PRF-23377 Class C

After 3 weeks B117-  
fasteners removed

After 3 weeks B117-  
Coatings removed

# Primer/Topcoat over Type IC Anodize

-after 3 Weeks in ASTM B117

As Painted and assembled

MIL-PRF-23377 Class N

Metal-rich primer

MIL-PRF-23377 Class C

After 3 weeks B117-  
fasteners removed

After 3 weeks B117-  
Coatings removed

# Primer/Topcoat over Adhesion Promoter

-after 3 Weeks in ASTM B117

As Painted and assembled

MIL-PRF-23377 Class N

Metal-rich primer

MIL-PRF-23377 Class C

After 3 weeks B117-  
fasteners removed

After 3 weeks B117-  
Coatings removed

# Primer/Topcoat over Adhesion Promoter

-after 3 Weeks in ASTM B117

As Painted and assembled

MIL-PRF-85582 Class N

MIL-PRF-23377 Class N

MIL-PRF-85582 Class C

After 3 weeks B117-  
fasteners removed

After 3 weeks B117-  
Coatings removed

# Recent Test Results- 7 month Beach Exposure of Galvanic Assemblies

**Main Effects: All Coatings**  
Data Means

# Recent Test Results- 7 month Beach Exposure of Galvanic Assemblies

**Interaction Plot: All Coatings**  
Data Means

# Next Step for Galvanic Assembly Use

- Complete current NC coatings assessment and document results
- Plan and execute similar assessment for Type II primers (as part of ESTCP NC primer project)
- Review data to see if there is a clear, useable requirement which could be established for corrosion resistance
- Use data to support
  - Potential incorporation in coating specifications
  - Education on value of passivating surfaces properly
  - Improved galvanic materials selection in design
  - New ways to make current materials less aggressive, i.e. low temp carburization as way to stabilize 316 CRES

# Non-chromate Coatings Engineering Circular

XX Date 2010

EC-434-xxx-2010

## TABLE OF CONTENTS

|   |   |
|---|---|
| <b>Foreword</b>   | 3 |
| <b>Chapter 1. Introduction</b>  | 3 |
| 1.1) Scope of this circular   |   |
| 1.2) Issue & Problem Statement  |   |
| 1.3) Activities Affected and Recommended Utility  |   |
| <b>Chapter 2. Overall Transition Approach</b>   |   |
| 2.1 Test Protocol   |   |
| 2.2 Demonstration and Validation Criteria   |   |
| 2.3 Implementation and Technology Transition  |   |
| <b>Chapter 3. Risk Analysis and Mitigation Strategy</b>   |   |
| 3.1 Safety and Readiness Risk Analysis  |   |
| <b>Chapter 4. NAVAIR Non-Chromate Technology Gap/Needs</b>  |   |
| <b>Appendix 1:</b> NAVAIR Fleet Readiness Center Depot Constraints due to Chromate Materials              |   |
| <b>Appendix 2:</b> Non-Chromate Primer Test Protocol Development, Demonstration/Validation                |   |
| <b>Appendix 3:</b> NAVAIR Application Areas of Hexavalent Chromium Alternatives and Implementation Status |   |
| <b>Appendix 4:</b> NAVAIR Non-Chromate Authorization Letters  |   |

**NON-CHROMATE  
COATINGS SYSTEMS**

NAV AIR

Month XX, 2010

AIR VEHICLE ENGINEERING (AVE) DEPARTMENT  
NAVAIR AIR SYSTEMS COMMAND

Distribution: \_\_\_\_\_ Initiated By: AIR 4.3.4

## Risk Analysis for Implementation of Non-Chromate Technology

| Probability of Failure for Non-Chromate Technology vs. Chromate* | Impact of Non-Chromate Technology Failure |   |                                  |            |
|--|---|---|----------------------------------|------------|
|  | Mishap, Replacement                       | Reduced Service Life, High Repair Costs | Increased Maintenance Activities | Negligible |
| High   |   |   |                                  |            |
| Medium   |   |   |                                  |            |
| Low  |   |   |                                  |            |
| Same as Chromate   |   |   |                                  |            |

\* Probability of failure of non-chromate technology based on sufficient laboratory testing, comparison to current chromate technology for a particular application, and AIR-4.3.4 endorsement.

|             |  |
|-------------|--|
| High Risk   | Critical Application Areas should be avoided until test data supports lowering risk level.<br>Ex. Critical Safety Items (CSI), susceptible to stress corrosion cracking (SCC), high cost for repair, inaccessible areas, etc. ** |
| Medium Risk | Application Areas that need careful consideration and review based on test data.<br>Ex. outer-mold-line, inner-mold line, faying surfaces, direct to metal, metal-to-composite contact, etc. **                                  |
| Low Risk    | Non-Critical Application Areas suitable for Dem-Val/Implementation based on test data.<br>Ex. composites without metallic contact, fiberglass, low impact - low cost components  |

\*\* Note: Factors such as platform/component operational environment and inspection intervals must be considered and may justify adjustment to the risk analysis level. Ex. Trainer aircraft operate in a less severe environment than ship based aircraft.

# NAVAIR Transition Strategy

- Engage all relevant levels and user communities –
  - Military & Commercial OEM's
  - Depot/Manufacturing Sites
  - Industry Partners, Chemical Manufacturers
  - O-level activities
  - Research & Development, Demonstration/Validation, Specifications, Technology Transition
- Implementation Path –
  - Lab validation – process and product performance
  - Field validation – process and product performance
- Risk Analysis & Mitigation – Application Axis vs. Platform/Basing Axis

# Non-chromate Coatings Test Protocol

## **ESTABLISH STANDARD PRACTICE – Minimize or eliminate false positives and negatives in accelerated testing**

- Use AA2024-T3 and AA7075-T6 aluminum panels. Use 1 sacrificial coating plated over high strength steel, such as IVD-Al/4340. Use standard 1018/1020 LC steel panels.
- Accelerated Test: ASTM B 117 Neutral Salt Spray, ASTM G 85 Annex 4 Acidified SO<sub>2</sub> Salt Spray, and GM9540P Cyclic Corrosion, and ASTM D 2803 Filiform Corrosion Resistance.
  - Run beyond the normal “minimum” specification requirements – 3000 hours in ASTM B 117, 1000 hours in ASTM G85 Annex 4, 120 cycles in GM9540P, and 2000 hours in ASTM D 2803.
- 1+ year minimum beach exposure test – at a facility with a documented salt-laden, corrosive local environment, such as the Kennedy Space Center corrosion test facility.
- Evaluate coatings in faying surface and fastener dissimilar metal couples, as well as with any specialty coatings, always with a known chromate control.
- Test all non-chromate primers in conjunction with currently authorized and promising non-chromate metal finishing technologies, i.e. MIL-DTL-81706, MIL-A-8625, TT-C-490, MIL-DTL-84388, etc.
- Evaluate alternatives with and without topcoat and with simulated damage (scribes) through the coating systems.
- As improved corrosion test methods become available, combine the test protocol with improved accelerated exposures.
- Test in faying surface and fastener dissimilar metal couples
- Evaluate compatibility with composites substrates, ceramics, and other electroplated/mechanically deposited coatings
